My Contribution to the Collaborative Static Website Project

My contribution to the collaborative static website project was focused on organizing the repository, managing the workflow, and developing the main structure of the website. I created and initialized the public GitHub repository and shared it with my team members so that everyone could work together using version control. I planned the work by creating separate feature branches such as feature-about, feature-contact, and feature-style based on the tasks assigned to each team member. I developed the main homepage (index.html), which works as the starting page of the website and provides the basic layout and navigation structure. I guided my teammates to create the About page, Contact page, and the CSS stylesheet for styling the website. I carefully reviewed all pull requests submitted by my team members to check whether the changes were correct and followed the project structure before allowing them to be merged into the main branch. After merging, I verified that the changes were properly combined and that the website was working without errors. I also found problems in the about.html file and informed the team member who worked on that page so the mistakes could be corrected. After the corrections were made, I reviewed the new pull request and merged it into the main branch. Finally, I deployed the website using GitHub Pages so that the project could be viewed online by anyone, and I regularly checked the deployed website to make sure that all updates from the repository were correctly shown on the live site. Through these tasks, I helped maintain proper collaboration, version control, and smooth deployment of the project.
